

THE PROBLEM

Whenever we go to any other place or city, we visit historical sites and places and we are keen to know about that place in detail. For that, we hire personal guide who guide us showcasing and telling about that place. Sometimes, he/she tells us about some more things also, that are not written on boards present there, sometimes they too tells us things, just to make himself say he knows better than others. Also, if something got missed in-between, they don't repeat the information.

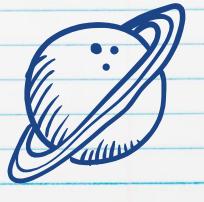

Moreover, a lot of money is spent on hiring guides; the main problem.

We are CodePros

WE will be working on this problem in this hackathon.

- · SIMARPREET SINGH.
- · PULKIT MIDHA
- · RAGHAV DHINGRA

TEAM NAME: - CODEPROS

THEME CHOSEN: - SMART CITY

HOW WE WILL DO IT?

We will be making an android application which will scan the monuments nearby and tell the details in the format of text, image, or video/gif.

This will save those heavy payments which are transferred to the guides.

Not only monuments, this app will also tell the information and the history of the detailings inside the monument premises, all that work that guides do.

This will greatly affect the tour expenditure for foreigner touristers.

For development, We are using VUFORIA inside unity. The database used inside the vuforia will be manually programmed by us instead of using any external API.

BIG CONCEPT

WHY NOT MAKE THEM AVAILABLE FOR ALL

EVERYTIME .?

Just take out your mobile phones, whenever you reach that specific spot or area, scan that and an media file about the history of that place, that will repeat itself till the user reaches the other spot or disable it.
